

Introduction

My report is for those who are planning to visit New York and want to make a day trip from Manhattan to Prudential center or Barclays center to see NHL match, visit a restaurant and grab a drink after the game.

New York is a big city there is much to do, but also surroundings are offering many interesting options. This example uses data to gather information about these surrounding activities for these two places that are alternatives for Madison square garden that is Manhattans top 1 arena to visit.

The Problem

In my report, I focus on the issue of which of the two surrounding arenas Prudential or Barclays is the best option to visit in day trip from Manhattan. Lets imagine that you are visiting new your with wife that are not so interested in hockey, but will go with you to hockey game, if there are other activities and good food also. Main questions for this problem are:

- Which of the options has better restaurants near the arena? top 5?
- Which of the options has better food & drink near the arena? top 5?
- Can the overall rating of these top 5 restaurants and food & drink places combined tell visitor which is better place to visit for day trip?
